

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

magnitude was estimated by Mr. OLIVIER to be 1.8, and the tail could be made out for eight or ten degrees. Numerous photographs have been made of it with the Crossley Reflector and with the Crocker cameras. In general, the head has been "umbrella-shaped," often showing well-marked concentric envelopes. The edges of the tail are much brighter than the center, which has occasionally been marked by a dark lane. The tail is of the streamer type, and both it and the details about the head change in aspect from night to night, but sudden changes and condensations do not appear. A very faint secondary tail is shown on the plate of April 29th, starting about two degrees from the head and making an angle of about fifteen degrees with the main tail. Some evidence is seen also of a faint jet directed toward the Sun.

H. D. CURTIS.

NOTE ON THE ORBITS OF COMETS HALLEY, *a* 1910, AND *e* 1909
(DANIEL).

The orbits of these three comets have recently been computed in the Berkeley Astronomical Department, and have yielded most satisfactory results from the standpoint of tests for Professor LEUSCHNER's methods of deriving differential corrections for the removal of residuals. The character of the orbits is different in all three cases. Halley's Comet furnishes an example for a very long arc in the case of a nearly parabolic orbit; Comet *a* 1910 for a parabola from both a short arc with unequal intervals, and a moderate arc having one position at the very trying place near perihelion with a very small heliocentric distance; and Comet *e* 1909 (DANIEL) furnishes an example for an ellipse of about six years' period from a moderate arc. The last also illustrates very neatly the great adaptability of the method in that the computers carried on the work for both parabola and general conic at the same time, with comparatively little extra labor.

The elements of Halley's Comet were computed by R. T. CRAWFORD and W. F. MEYER from observations of 1909 September 17, 1909 December 16, and 1910 February 28. They are:—

$$\begin{aligned}
 T &= 1910 \text{ April } 19.67760 \text{ Gr. M. T.} \\
 \omega &= 111^\circ \quad 43' \quad 09''.32 \\
 \Omega &= 57 \quad 16 \quad 18.09 \\
 i &= 162 \quad 12 \quad 55.57 \\
 \log e &= 9.985 \quad 5082 \\
 \log a &= 1.252 \quad 5224 \\
 \log q &= 9.768 \quad 6346
 \end{aligned}
 \left. \vphantom{\begin{aligned} \omega \\ \Omega \\ i \end{aligned}} \right\} 1910.6$$

The perturbations due to the action of *Mars* at its nearest approach to the comet, during January, 1910, were computed and found to be ineffective.

The elements of Comet *a* 1910 were computed by W. F. MEYER and Miss SOPHIA H. LEVY. The first set was derived from observations of February 1st, 2d, and 5th. The final set was based upon observations of January 18th, February 5th, and March 13th. They are:—

$$\begin{aligned}
 T &= 1910 \text{ January } 17.0888 \text{ Gr. M. T.} \\
 \omega &= 320^\circ \quad 54' \quad 40''.3 \\
 \Omega &= 88 \quad 47 \quad 24.1 \\
 i &= 138 \quad 46 \quad 47.9 \\
 q &= 0.128980
 \end{aligned}
 \left. \vphantom{\begin{aligned} \omega \\ \Omega \\ i \end{aligned}} \right\} 1910.0$$

The largest residual for this orbit is 3". An observation of April 13th, by AITKEN, shows the residuals—

$$O - C \left\{ \begin{aligned} \cos \delta \Delta \alpha &= -0''.9 \\ \Delta \delta &= -4'' \end{aligned} \right.$$

An orbit for Comet *e* 1909 (DANIEL), showing a period of 7.15 years, was derived by STURLA EINARSSON and R. YOUNG from observations of December 11th, 15th, and 18th. A longer arc became available so that their final elements depend upon observations of 1909 December 7, 1909 December 18, and 1910 March 3. They are:—

$$\begin{aligned}
 T &= 1909 \text{ November } 28.7238 \text{ Gr. M. T.} \\
 \omega &= 3^\circ \quad 28' \quad 43''.9 \\
 \Omega &= 70 \quad 59 \quad 43.4 \\
 i &= 19 \quad 26 \quad 48.1 \\
 e &= 0.602481 \\
 \mu &= 547''.5362 \\
 \log a &= 0.541063 \\
 \text{Period} &= 6.48030 \text{ years}
 \end{aligned}
 \left. \vphantom{\begin{aligned} \omega \\ \Omega \\ i \end{aligned}} \right\} 1910.0$$

All three cases required the use of LEUSCHNER's closed expressions for δf and δg , which worked admirably.

R. T. CRAWFORD.

BERKELEY ASTRONOMICAL DEPARTMENT, April 21, 1910.

NEW SPECTROSCOPIC BINARIES.

The following forty-two binaries have recently been discovered during the progress of the spectrographic work at the Lick Observatory and at the observatory of the D. O. Mills Expedition, Santiago, Chile. They are taken from *Lick Observatory Bulletins*, Nos. 173, 177, and from a Bulletin soon to be issued by Dr. MOORE:—

Star.	<i>a</i>	<i>δ</i>	Range.	Discoverer.
λ <i>Hydri</i>	0	45.1 — 31° 57'	— 12 to + 6 ^{km}	Mrs. MOORE
ν <i>Piscium</i>	1	14.0 + 26 44	— 1 to + 22	ALBRECHT
π <i>Ceti</i>	2	39.4 — 14 17	+ 8 to + 21	MOORE
κ <i>Persei</i>	3	2.7 + 44 29	+ 27 to + 32	CAMPBELL and ALBRECHT
δ <i>Fornacis</i>	3	38.3 — 32 15	— 25 to + 64	MOORE
b <i>Persei</i>	4	10.7 + 50 3	— 4 to + 52	CURTIS
γ <i>Mensæ</i>	5	35.8 — 76 25	+ 54 to + 62	Mrs. MOORE
ξ <i>Columbæ</i>	5	52.1 — 37 8	+ 55 to + 66	Mrs. MOORE
δ <i>Canis Majoris</i>	7	4.3 — 26 14	+ 33 to + 36	WRIGHT
27 <i>Canis Majoris</i>	7	10.2 — 26 10	+ 86 to + 115	ALBRECHT and PADDOCK
h ¹ <i>Puppis</i>	8	7.8 — 39 19	+ 17 to + 30	Mrs. MOORE

W. W. CAMPBELL.

APPOINTMENT OF DR. ALBRECHT.

Dr. SEBASTIAN ALBRECHT, Fellow in the Lick Observatory, University of California, 1903-06, Assistant 1906-08, and Assistant Astronomer 1908-, has been appointed First Astronomer in the Argentine National Observatory at Cordoba. Dr. PERRINE, Director of the Cordoba Observatory, is to be congratulated upon securing the services of Dr. ALBRECHT, whose departure from Mount Hamilton will be regretted by all, for both scientific and personal reasons. Dr. ALBRECHT expects to leave Mount Hamilton on or shortly after July 1st.

W. W. CAMPBELL.
